

Automatic Weaning Machine for Calves

The weaning machine for calves, named VS60, has been entirely conceived, projected and manufactured by PTM; the simplicity in use, due to its graphic display and the structure in stainless steel, makes VS60 one of the most reliable machine for calves' feeding present in the market. A big advantage to take into consideration it is the possibility to work with a single or with two independent feeding stations. The automatic weaner for calves is equipped with an electronic scale, with graphic display and able to follow and program the operations, and with a printer thanks to which it is possible to report said information, on paper too if required. Furthermore, it is possible to examine and control the feeding and dosage plans by the weight and it permits to have an archive with each animal's data. This last information is really very important since each calf, duly registered and identified through a transponder, is strengthened with a proper dosage of integrators and specific vitamins as per each animal's needs considering relevant weight, height, robustness and, generally speaking, the calf's constitution. At this regard it is good to point out the use of the retractile nipple through which is effected the integrator dosage for each animal. The last but not the least for its importance as far the hygiene and cleanliness are concerned, it is the presence of the automatic washing of the milk bottle and distribution pipes.

TECHNICAL CHARACTERISTICS:

- | |
|---|
| ▼ 30 + 30 programmable animals |
| ▼ One kind of milk-powder |
| ▼ Possibility to use liquid milk and all types of milk |
| ▼ Integrators and vitamins dosage for each animal |
| ▼ Archive with each animal's data |
| ▼ Electro-pneumatic valves |
| ▼ Automatic washing of milk bottles and pipes |
| ▼ Dimensions: Height: 1.300 x Width: 1.000 x Length: 450 mm |
| ▼ Weight: 85 Kilos |
